## Abstract

1

- 2 Watermark and pattern detection can be improved by compensating for artifacts
- 3 introduced into an image by a printer and/or scanner through which the image has
- 4 passed. With the present invention, prior to watermark or pattern detection, the image is
- 5 filtered or modified to compensate for artifacts introduced by the printer and/or scanner.
- 6 Some scanners automatically compensate for artifacts introduced by the scanner by
- 7 using a calibrated tone map. The automatic compensation provides an image from
- which, a watermark can be easily read. However, generally the user is provided with an
- 9 interface which can be used to change certain parameters such contrast and intensity.
- 10 The changes made by the user change the compensation (i.e. the tone map) applied to
- the image. If the user changes the compensation applied to the image it can affect the
- 12 ability to read the watermark. The present invention provides a system which reverses
- any compensation introduced by the user so that the watermark or pattern can be more
- easily read. In another embodiment the invention takes into consideration that some
- printers and scanners have transfer functions which differ in the "x" and "y" directions.
  - Thus the compensation introduced by the filter can differ in the "x" and "y" directions. In
- one embodiment, a scanner introduces aliasing frequencies into an image. Detection is
  - improved by selectively removing certain frequencies. In another embodiment, the filter
- compensates for fact that the scanner frequency response falls off at higher frequencies.
